Sun, 09 Dec 2018 08:41:00 GMT Microbial biodegradation - Wikipedia - Glyphosate is an aminophosphonic analogue of the natural amino acid glycine, and like all amino acids, exists in different ionic states depending on pH. Both the phosphonic acid and carboxylic acid moieties can be ionised and the amine group can be protonated and the

substance exists as a series of zwitterions. Glyphosate is soluble in water to 12 g/l at room temperature. Tue, 04 Dec 2018 20:43:00 GMT Glyphosate - Wikipedia - 1.. Introduction Enzymes are considered as nature's catalysts. Most enzymes today (and probably nearly all in the future) are produced by the fermentation of biobased materials. Lipids constitute a large part of the earth's biomass, and lipolytic enzymes play an important role in the turnover of these water-insoluble compounds.
